PROFESSIONAL SUMMARY

Thirty-one years, eight domains, every one unfamiliar on arrival: quality systems, capital governance, corporate FP&A, IT asset management, enterprise security migration, IT modernization, field workforce capacity, and most recently equity research systems. The assignment has always been the same. Go into something complicated that nobody fully owns, find out what is actually happening rather than what the three-year-old presentation says is happening, quantify what the gap is costing, then build something measurably better that keeps running after I leave. I am a Lean Six Sigma Black Belt who builds what I diagnose. I wrote the Python and SQL myself for fifteen years, with a browser open for syntax. Now AI writes it and I direct and verify it. The scarce part was never the typing.

TECHNICAL SKILLS

Python (pandas, NumPy) | SQL (CTEs, window functions, ETL) | PostgreSQL / MS SQL Server / Oracle DB | GenAI Orchestration and Agent Workflows | Grafana / Streamlit | Jira | DMAIC | IDEF0 and SIPOC Decomposition | Value Stream Analysis | ADKAR Change Management | Agile / Scrum (PSM I) | ITIL v3 | CMM / CMMI | ISO 9000

PROFESSIONAL EXPERIENCE

Principal Consultant | Cornerstone Solutions | Northern Virginia

Dec 2025 - Present

Cornerstone is the vehicle for a contracted client engagement and for the tooling that came out of it. Through the first half of 2026 it was a practice being stood up while I was in the market and deliberately building the AI-assisted delivery skills the work now runs on; the first client engagement began in July 2026.

- Meridian, client engagement, in build under contract. An AI-assisted research system for a private investor. Ran discovery first: requirements, evaluation of twelve candidate data providers, and the system architecture. Modeled the client's operating process before designing anything, and that model became the architecture's top-level decomposition, so the build is structured by the process rather than the reverse.
- Took Meridian into production build: twelve ingestion sources into PostgreSQL, an analytics layer, and a reporting surface. Cut the nightly transform window from seven hours to four by measuring where the time actually went and reverted a vectorization approach after measuring it 3.3x slower than what it replaced.
- Built Forester, a process modeling platform that encodes the IDEF0, SIPOC, ICOM and value stream methodology used across three decades of engagements. One captured model generates six industry standard diagram languages automatically at every level of the decomposition, including BPMN 2.0 that opens in Camunda with layout intact.
- Instrumented Forester with thirty-five derived metrics across six stakeholder lenses (flow, capability, capacity, quality, equipment, economic), plus a methodology coach that detects contradictions between nodes and proposes ranked, one click resolutions. Seventeen sprints, feature complete, not publicly launched.

Sr. Manager | Verizon | Ashburn, VA

Feb 2019 - Dec 2025

Led enterprise workforce capacity analysis for Global Network Operations and transformation portfolio governance for Global Network Management, serving as de facto Chief of Staff to VP level leadership across a \$455M portfolio that delivered 128% of value to target.

- A thousand-person field organization was carrying overtime while skills sat idle elsewhere, and nobody could see it because the work area map underneath had grown without governance: incomplete, non-contiguous, and redundant, with a single ZIP code appearing in six different areas. Rebuilt the foundation from zero with the field supervisors, mapping all 41,326 ZIP codes contiguously with each one in exactly one area. That 1:1 constraint improved automated dispatch accuracy 10% on its own.
- Volunteered to build what the clean foundation now allowed: a Force-to-Load capacity model in Python and SQL that mapped skill supply against demand by geography and shift, surfacing \$18M to \$22M in hidden capacity and securing 50 FTEs on the data-backed business case.
- Automated financial governance reporting for the \$455M portfolio using Python and SQL pipelines, eliminating 200+ manual hours per user annually at 100% reporting accuracy. Other program teams adopted the same pipeline for their own portfolios.
- Built the analytical models spanning fixed wireless and network operations that surfaced \$19.5M in directly attributable, conservatively scoped savings across a multi-year transformation portfolio, including \$2M isolated in non-productive vendor spend, scalable to \$10M.

Manager | Verizon | Ashburn, VA

Jan 2013 - Jan 2019

Served as primary Black Belt on enterprise IT asset management, security migration, and IT modernization programs, leading cross-functional teams through process transformation and building the governance that held after each program closed.

- An enterprise expense mandate arrived with the usual reflex of freezing hiring and finding headcount to cut, but the waste in the IT asset lifecycle had become invisible: 400 distinct activities, 110 handoffs, 64 interconnected systems. Co-facilitated a Work-Out session running from the data center floor to the SVP level so the people who would live in the new model helped build it.
- Removed 43% of the critical path, realized \$40M in annual expense savings, and decommissioned 5,000 legacy servers.
- Accelerated asset acquisition 82%, from 17+ weeks to under three, by optimizing the critical path rather than adding resources to it.
- A 30,000 server security migration was moving at fifteen servers per week, well short of every executive deadline. The people were working hard; the system they worked inside was the constraint. A DMAIC rebuild pulled 27 disconnected data sources into one view of server readiness and re-sequenced the workflow into a pull-based pre-qualify, schedule, implement order, so failures surfaced before change windows rather than inside them. Sustained velocity reached 500 servers per week at peak, a 33x improvement.
- Reduced hardware holding times 84% and raised two-week asset utilization to 80% through supply chain process controls, and mentored 8 IT Green Belts through full project execution and certification.

TECHNICAL PROJECTS

Founder and Full-Stack Developer | Benson Academy | Northern Virginia

May 2025 - Present

Designed and shipped a production Next.js and TypeScript web application solo, built on a human-in-the-loop AI content pipeline where a grounded knowledge base is the source of truth and nothing publishes without human review.

- Applied Lean Six Sigma to the content production lifecycle, cutting research to published cycle time roughly 80% while maintaining source traceability and zero tolerance for unverified claims.
- Architected the hallucination control pattern deliberately rather than incidentally: RAG knowledge base as source of truth, LLM generation, custom Python asset automation, and a mandatory human review gate before publication.

EARLY CAREER EXPERIENCE

Senior Member of Technical Staff | Verizon | Silver Spring, MD

Delivered process architecture and governance for large-scale IT operations, applying Lean, Six Sigma, and CMM/CMMI to assess maturity, remove waste, and establish frameworks that outlived the programs that produced them.

- A skilled, motivated 24x7 operations team was losing half its people every year. It was not a pay problem and it was not a culture problem: nobody had documented how the work was supposed to be done, so every technician was guessing through mission-critical tasks. Built an ISO 9000 quality system by walking technicians through their actual daily work, producing 143 standard operating procedures with process flows and decision trees for the edge cases. Attrition fell from 50% to 1%, procedural errors dropped 86%, critical outages fell 80%, and all availability targets were met for the first time in the group's history.
- Re-engineered corporate FP&A processes for a \$3B portfolio, cutting monthly reconciliation cycle time 70%, improving process capability 450%, and delivering \$4.2M in annual productivity value.
- Architected a data integrity governance layer in SQL that made post-merger synergy numbers defensible, validating \$500M in net savings across a \$3B OPEX portfolio.
- Instituted capital prioritization governance for Data Center Operations that diverted \$2.0B in low-priority demand while maintaining 98% budget attainment.
- Designed an application release process that governed 40,000+ IT changes over twenty years, increasing team capacity 300% while sustaining above 99.90% availability.

EDUCATION

- Master of Arts (M.A.) in Organizational Management | University of Phoenix
- Bachelor of Arts (B.A.) in Computer Systems & Psychology | Grove City College

CERTIFICATIONS

- Master's Certificate - Project Management (PMBOK)
- Lean Six Sigma Black Belt
- Professional Scrum Master (PSM I)
- ITIL v3 Service Management

SECURITY ELIGIBILITY

- GSA Public Trust Suitability, *inactive* (granted 2021).
- DoD Secret Clearance, *inactive* (held 1991-1993).
